Salt Lake City Department of Airport's Terminal Redevelopment Program:

The Terminal Redevelopment Program (TRP) is designed to build a new consolidated landside terminal, concourses, baggage handling system, rehabilitate existing concourses A, B C and D, associated airfield work, roadway improvements, construction of a central utility plant, parking, and associated improvements.  The TRP will replace existing terminal facilities that were constructed 30 to 50 years ago and have reached the end of their useful life.  The TRP will also increase capacity by eliminating operational shortfalls in existing facilities and creating gates that accommodate current and future fleet mixes.  This project will also address the need to seismically retrofit existing facilities to meet current building codes.  SLCDA has evaluated a wide range of options and determined that the construction of the TRP is the most effective solution to seismic, operational, and capacity constraints of current facilities.
